

Supplying Artwork to Multiprint UK - STATIONERY

We can accept files via email, CD-ROM, Floppy Disc, USB device or down-load them from your own servers. We prefer to receive Hi-Res (Press Quality) PDF files.

We are able to accept other file formats such as MS-Word or MS-Publisher and convert them (Prices start from £15). However you should be aware that designs made in MS-Word or MS-Publisher are difficult to accurately print from due to font and colour variation problems. We do not accept any responsibility for any errors in printing jobs designed in these or similar programs.

To make sure your pdf has not corrupted you must also send us a proof, this could be a .jpg output of the file so we can cross reference the two or you should post us a hard copy print out particularly if you want something colour matching to a previous job.

Colour Variations in jobs

Colours can vary using the full colour printing process between jobs, never assume the printed job will match your screen colours, we do not accept any liability for colour difference between jobs if you have not supplied a hard copy proof or purchased a colour proof from us or supplied a copy of something that has been printed before.

Please bear in mind different paper types will affect colour for example 100gsm uncoated Letterhead paper will produce different results to 400gsm coated business card stock so colour differences are to be expected.

If you are looking for exact matches between batches of printing you should consider spot colour printing as this is usually done one job at a time and using a specific ink colour making accurate colour control much easier to achieve.

Your artwork should consider the following:-

The term bleed is used to describe printing a colour right to the edge of the paper. To achieve this effect we must print the image bigger than required onto larger sheets of paper, then trim the edges to the desired size, which gives you the bleed effect. Bleed should be set at 3mm.

It is equally important to keep things such as text at least 3mm (preferably 5mm+) inside the cut line or you risk it being cut off or undesirably close to the edge. Please ensure all images are set to a minimum of 300dpi. and are converted to CMYK (not RGB).

When using black text make sure your CMYK settings are C0% M0% Y0% K100% this will give you sharper text. However if you are designing a solid black area then increase the ink to give a deeper black for example:- C25% M25% Y25% K100%.

PAPER SIZES

A0	1188mm x 840mm
A1	840mm x 594mm
A2	594mm x 420mm
A3	420mm x 297mm
A4	297mm x 210mm
A5	210mm x 148mm
A6	148mm x 105mm
A7	105mm x 74mm
DL	210mm x 99mm
Business Cards	85mm x 55mm
